

Challenge :	The Disabled Gate
Category :	Client Side HTML Manipulation
Difficulty :	Easy
Tools Used :	Any modern browser (Google Chrome, Firefox, Edge), used safari below.

Summary

This challenge focuses on the misconception that visual restrictions on a webpage equal actual security. It demonstrates how a developer's reliance on a "disabled" button attribute can be easily bypassed by a user who understands how to modify the local HTML code directly in their browser.

Problem Statement

Inside one of the storefront panels, you find an admin console—but access appears restricted. The interface suggests elevated privileges exist, yet the entry point seems intentionally disabled. The system assumes that if something cannot be interacted with, it cannot be used. That assumption may be incorrect.

Steps to solve

1) Investigate the Element:-

Start by right-clicking the greyed-out “Admin Login” button and selecting Inspect. This opens the Developer Tools directly to that button’s code (If its blocked, open inspect in tab first, then open the challenge link on the same tab).

Hints Used - Hint 1 (The Client Side Illusion) & Hint 2 (Peeking Under the Hood) :-
These remind you that the restriction is happening on your own computer, not the server, allowing you to use your browser's tools to look at the underlying code.

2) Locate the Restriction:-

Look at the highlighted (<button>) tag in the HTML panel. You will notice a specific attribute within the tag: (disabled).

Hints Used - Hint 3 (Finding the Restriction with Developers Tools) :-

This guides you to look specifically for the single word attribute that makes elements unclickable and grey.

3) Modify the HTML:-

Double click the word (disabled) inside the tag and delete it entirely, then press Enter.

Hints Used - Hint 4 (The Exploit) :-

This provides the direct instruction to locate and remove the specific word to reactivate the button.

4) Capture the Flag:-

Once the attribute is removed, the button will instantly turn green and become clickable. Click the button to trigger the hidden JavaScript function and reveal the flag.

Flag Captured: `Cruxhunt{Insp3ct_3l3m3nt_1s_y0ur_fr13nd}`
