

Challenge:	The Borrowed Identity
Category:	Broken access control and cookie manipulation
Difficulty:	Easy
Tools Used:	Browser built-in Dev tools

Summary

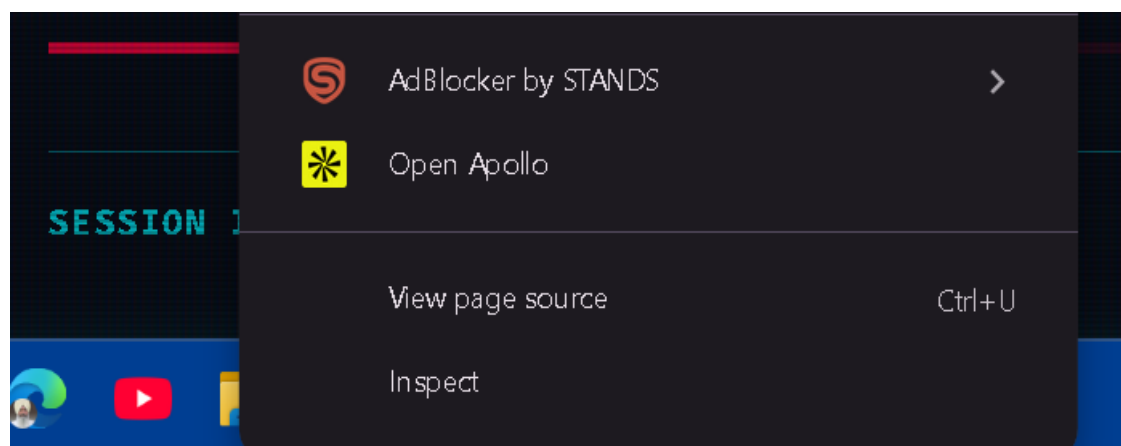

The vendor denies you access, and role as insufficient in the question, indicating to us that we need to get root/admin access. The website uses cookies to remember certain information about us, which it later uses to authenticate us. So, we need to change the cookie information. So, we navigate to the cookies in the application tab in developer tools by right-clicking Or by pressing F12. There, we see the name and value, and we try to change them. We change the value from 'guest' to 'admin'. Then refresh the page. Hence, we find the flag.

Problem Statement

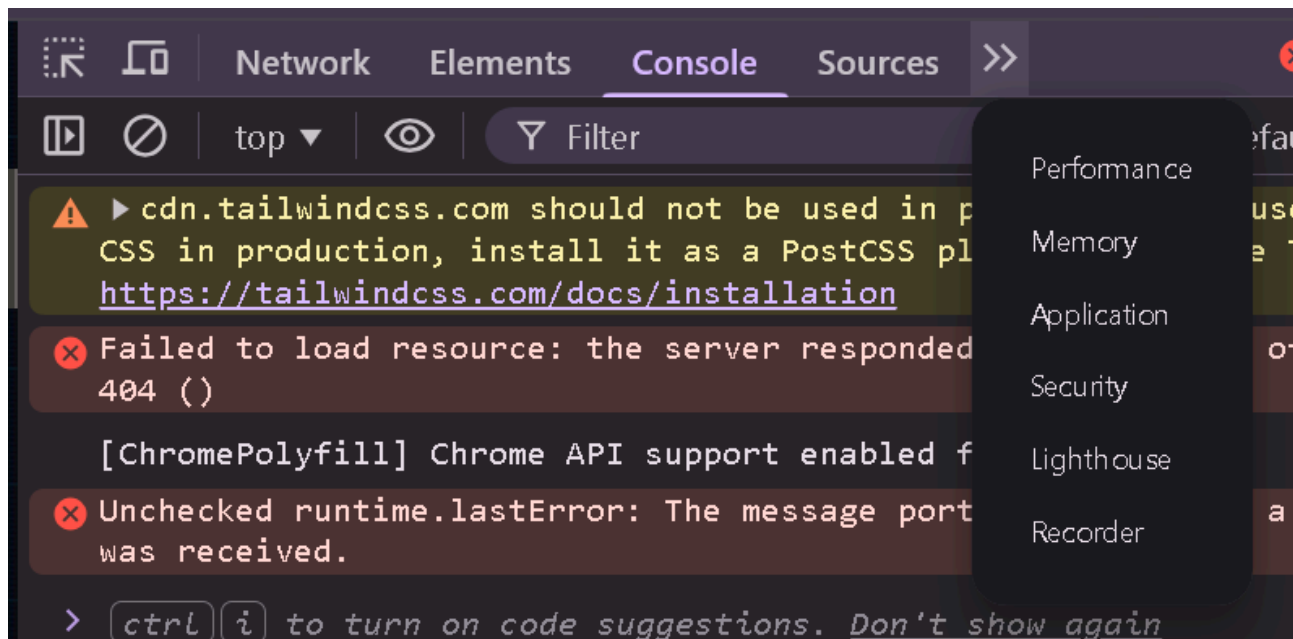

A vendor dashboard denies you access, identifying your role as insufficient.
The system does not verify identity through any visible authentication mechanism—only through what it remembers about you.
If the system trusts what it is told, then the question becomes:
Who is doing the telling?

Steps to solve:

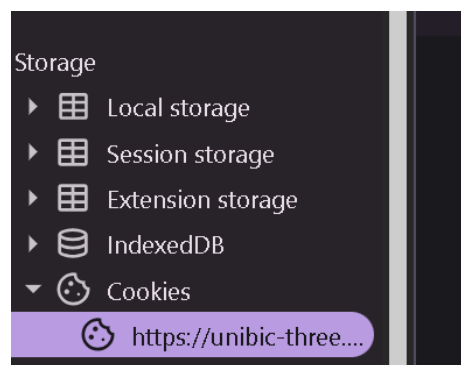

- 1) Click on the link for the vulnerable site. unibic-three.vercel.app
- 2) Open the developer tool by right-clicking on the website, then click on 'inspect' or press F12.

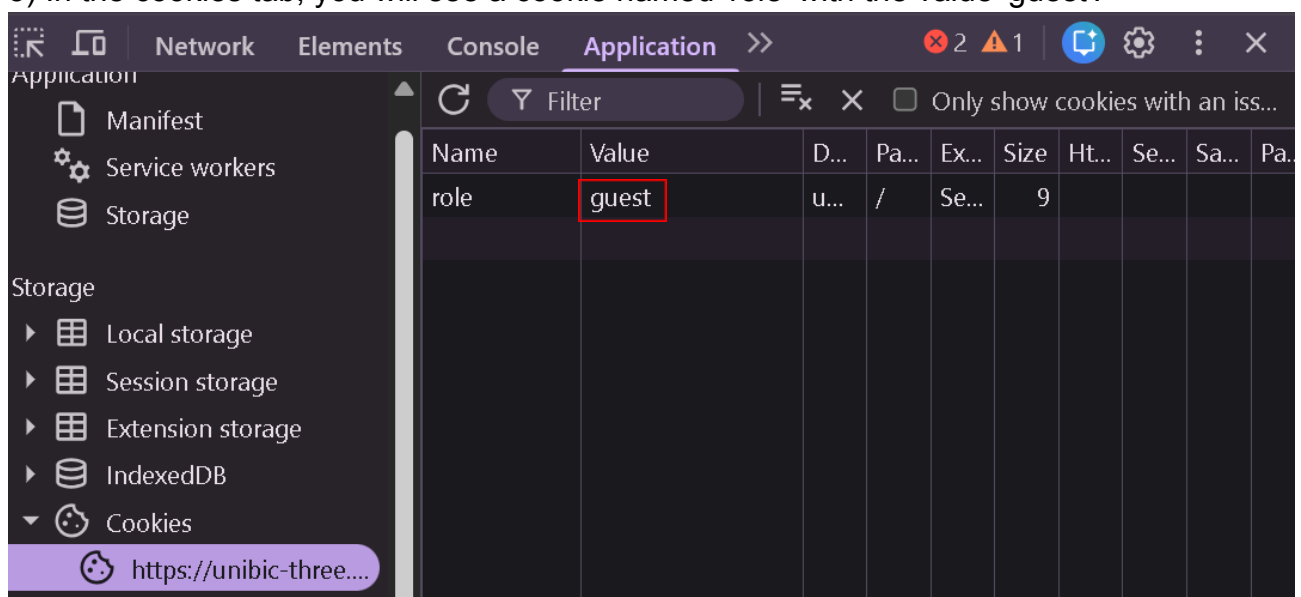

3) Navigate to the application tab (Chrome/Edge) or storage tab (Firefox).

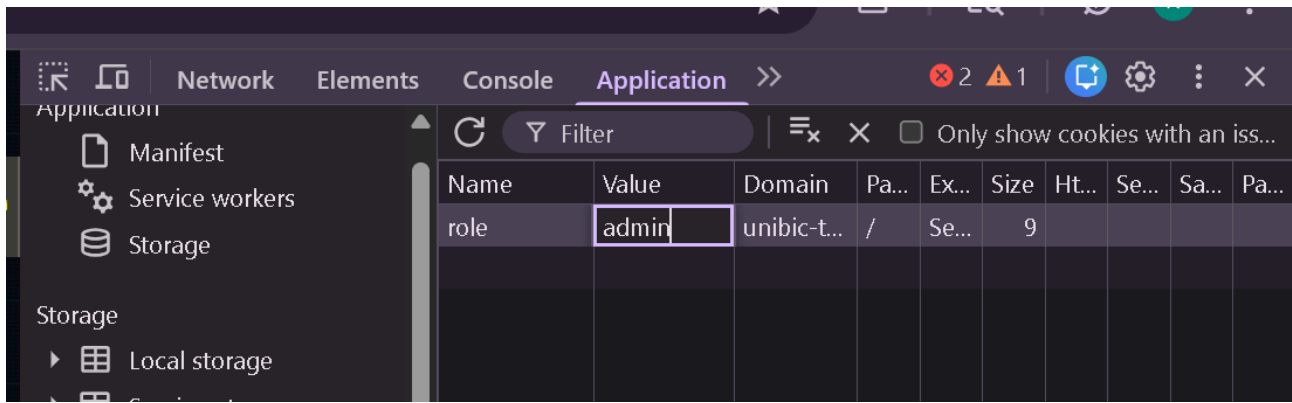

4) On the left-hand side, expand the cookie's section and click on the website link.

5) In the cookies tab, you will see a cookie named 'role' with the value 'guest'.

6) By double-clicking on the value, change the value from guest to admin.

7) Now, refresh the page. You will be able to see the flag.
